Newmill Trout Fishery - Lanark

Newmill Trout Fishery is one of the busiest fishing venues in Scotland. Located 3 miles from the town of Lanark it is widely known as one of the best of its kind in Scotland. Nestling amongst 100 acres of wooded countryside Newmill caters to all aspects of the sport, boasting 7 ponds ranging from 1 acre to 8 acres. With added benefits of the coarse fishery, a fishing mad tackle shop and truly unique camping pods each with electricity, a fire pit and toilet facilities.

When looking into how to better their business Newmill Trout Fishery, due to the nature of the company and their location sustainability and their carbon footprint came to the forefront of their strategy plan. Finding a method that can help their strategy as well as better their operation cost made Newmill investigate renewable energy to help in all aspects of their business.

Renew-Able's Intervention:

- Solar Panels: 400W Mono Solar Panel
- Inverter: Growatt 11000TL3-5 Inverter

“Renew-Able Solutions planned and delivered our solar system with the utmost professional and helpful manner, from original advice to complete installation was reasonable priced and completely hassle free. The 11kva system has now been installed for a couple of months and is working well and watching, in effect, free power come into our business is fantastic.”- David Buchanan

Investing in renewable energy aligns the fishery with environmental conservation efforts, minimizing its carbon footprint and preserving the ecosystems it relies on. This commitment to sustainability not only enhances the fishery's public image but can also attract environmentally conscious consumers and investors. Additionally adding solar panels has significantly reduced the fishery's electricity costs over the long term, which is particularly significant in energy-intensive processes like water circulation and refrigeration. By harnessing sustainable energy, the fishery can insulate itself from rising energy prices and ensure greater financial stability.
